

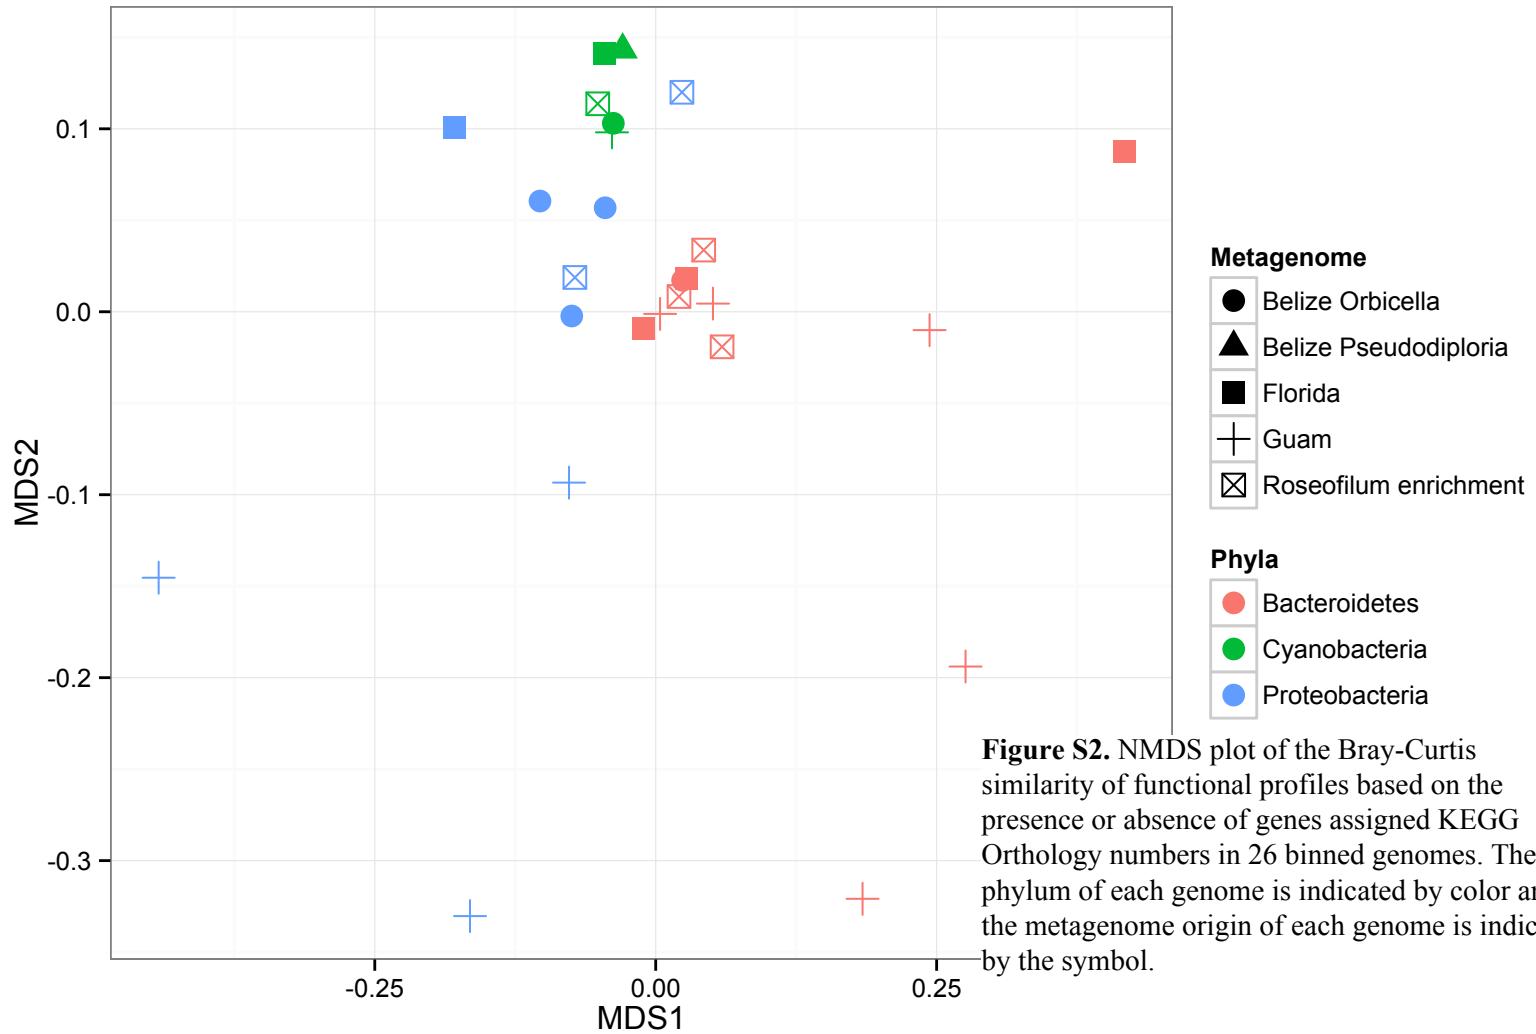

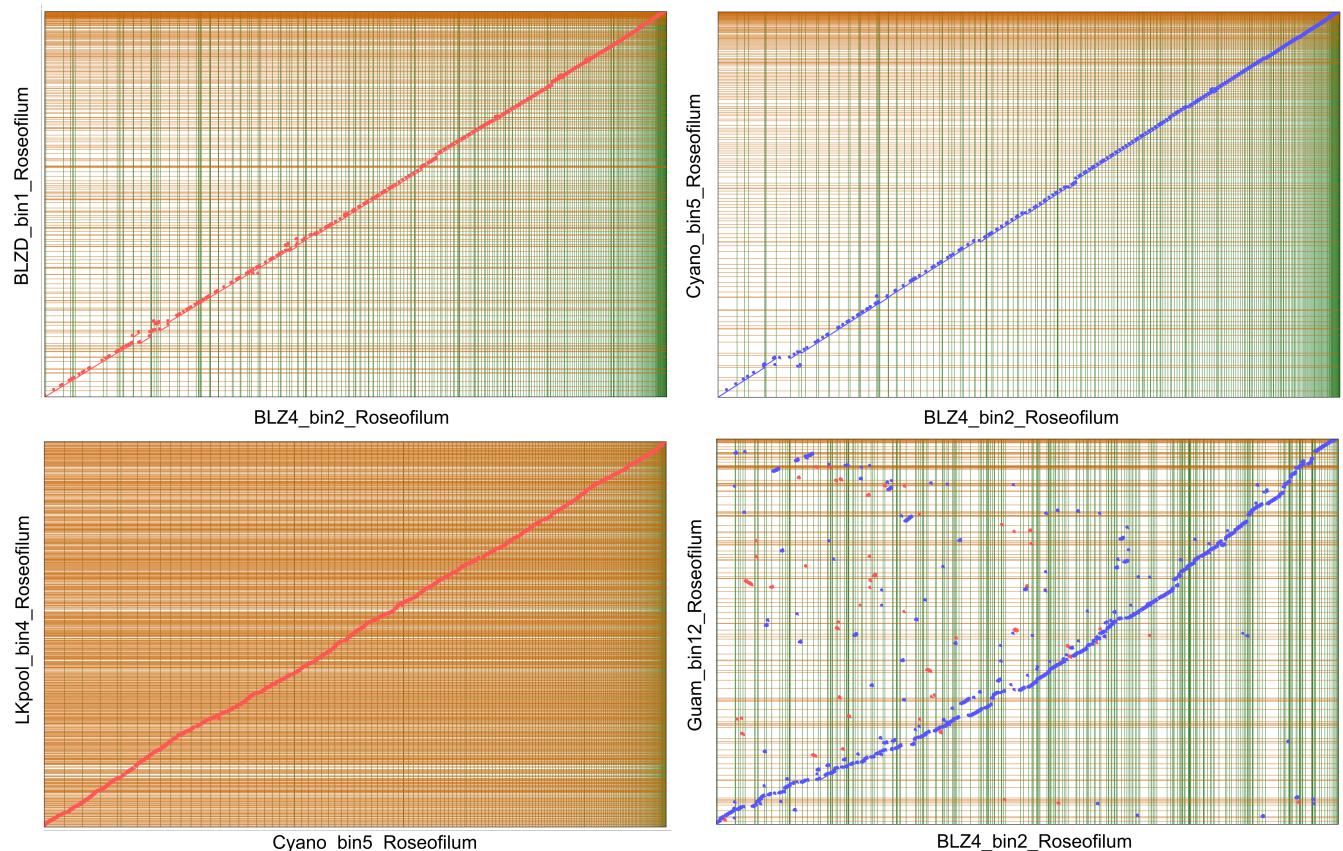

**Figure S1.** Comparison of A) the coverage (number of sequencing reads mapped to assembled metagenomes) of functional genes assigned to phyla in the non-axenic *Roseofilum* culture and four Black Band Disease mats and B) the relative abundance of 16S amplicon sequences assigned to major bacterial phyla in the same samples.

**Figure S2.** NMDS plot of the Bray-Curtis similarity of functional profiles based on the presence or absence of genes assigned KEGG Orthology numbers in 26 binned genomes. The phylum of each genome is indicated by color and the metagenome origin of each genome is indicated by the symbol.

**Figure S3.** Pairwise dot-plot comparisons of the contigs in *Roseofilum* genomes demonstrates high gene synteny among the four Caribbean-based samples and greater genome rearrangements in the Guam sample.

**Table S1.** Summary of sample characteristics for 54 coral surface microbiomes and 1 *Roseofilum* culture used to assess bacterial community structure based on the V6 hypervariable region of 16S rRNA genes.
