# DESCRIPTION OF A NEW CRAB FROM DOMINICA, WEST INDIES.

#### BY MARY J. RATHBUN.

By permission of the Secretary of the Smithsonian Institution.

Among a number of crustaceans sent to the United States National Museum by Mr. A. Hyatt Verrill, for determination, there is a new species of Catometopa, as follows:

### Pseudorhombila octodentata sp. nov.

Type.—Male, dried. Dominica. A. Hyatt Verrill, collector, Cat. No. 32,690, U. S. National Museum.

Characters.—Carapace very convex fore and aft, regions indistinctly defined, surface closely set with flattened granules. Front subtruncate, a V-shaped median notch, a rounded lobe at outer angle. Antero-lateral teeth four (orbital angle excluded); the first small, separated from the orbit by a long straight interval; second tooth widest, third and fourth most acute, the third the larger, the fourth the most projecting.

Left cheliped missing; right one strong, covered with fine reticulated granulation; merus projecting little beyond the body, a strong subterminal tooth above; carpus subquadrate, with a conspicuous tooth at inner angle, and the outermost portion tuberculate; palm nearly twice as long as high, widening distally; dactylus as long as palm; both fingers strongly deflexed, not gaping, tips curved and overlapping.

Ambulatory legs long and narrow; meral joints granulate above and below, carpal joints above; some small superior spines on the merus. Dactyli with two fringes of long hair.

The second segment of the abdomen leaves exposed a large piece of the sternum on either side; third to fifth segments fused.

Measurements.—Length, 33.3; width, 46.1; fronto-orbital width, 24.7; width of front, 12.9; length of propodus of right cheliped, 39; length of merus of third ambulatory leg, 26.5 mm.

Remarks.—This species is very like *P. quadridentata* (Latreille) Milne Edwards,\* a cotype of which is in the United States National Museum, but the latter has a more uneven carapace, fewer antero-lateral teeth in the male, and a longer postero-lateral margin.
