SERIES PUBLICATIONS OF THE SMITHSONIAN INSTITUTION

Emphasis upon publication as a means of "diffusing knowledge" was expressed by the first Secretary of the Smithsonian. In his formal plan for the Institution, Joseph Henry outlined a program that included the following statement: "It is proposed to publish a series of reports, giving an account of the new discoveries in science, and of the changes made from year to year in all branches of knowledge." This theme of basic research has been adhered to through the years by thousands of titles issued in series publications under the Smithsonian imprint, commencing with *Smithsonian Contributions to Knowledge* in 1848 and continuing with the following active series:

Smithsonian Contributions to Anthropology
Smithsonian Contributions to Astrophysics
Smithsonian Contributions to Botany
Smithsonian Contributions to the Earth Sciences
Smithsonian Contributions to the Marine Sciences
Smithsonian Contributions to Paleobiology
Smithsonian Contributions to Zoology
Smithsonian Studies in Air and Space
Smithsonian Studies in History and Technology

In these series, the Institution publishes small papers and full-scale monographs that report the research and collections of its various museums and bureaux or of professional colleagues in the world of science and scholarship. The publications are distributed by mailing lists to libraries, universities, and similar institutions throughout the world.

Papers or monographs submitted for series publication are received by the Smithsonian Institution Press, subject to its own review for format and style, only through departments of the various Smithsonian museums or bureaux, where the manuscripts are given substantive review. Press requirements for manuscript and art preparation are outlined on the inside back cover.

ABSTRACT

Culver, Stephen J., and Martin A. Buzas. Distribution of Recent Benthic Foraminifera in the Gulf of Mexico. *Smithsonian Contributions to the Marine Sciences*, number 8, 2 volumes, 898 pages, 296 figures, 3 tables, 1981.—A computer file of all published (presence or absence) distributional data on the living and dead recent benthic foraminifera in the Gulf of Mexico was constructed from 77 papers published since 1918. Manipulation of this file produced 5 catalogs and 296 maps.

Catalog 1 lists alphabetically species names with publication and locality information as recorded in the literature (i.e., unsynonymized). Catalog 2 lists synonymized species names (in the same numerical line order as Catalog 1) with publication and locality information. Catalogs 3 and 4 list alphabetically all unsynonymized and synonymized species names, respectively. Catalog 5 lists synonymized names by increasing latitude and longitude.

During the past 60 years, 1219 names have been used to record benthic foraminifera in the Gulf of Mexico. Through synonymization, these were reduced to 848 species, of which 295 occur at 16 or more of the 426 sample localities. Computer-generated maps were drawn for these 295 most commonly recorded species.

Species were grouped by depth and geographic distribution through visual examination of the maps. Twenty overlapping categories describe the depth distribution of the commonly recorded species. The depth distribution of 15 species varies considerably around the Gulf.

Geographically the 295 most commonly recorded species may be grouped into 11 categories. Forty-eight percent of the species are ubiquitous around the Gulf. Circum-Gulf of Mexico provincial boundaries cannot be recognized but preliminary analysis distinguishes concentric benthic foraminifer provinces whose margins can be related to particular depths and physiographic regions.

OFFICIAL PUBLICATION DATE IS handstamped in a limited number of initial copies and is recorded in the Institution's annual report, *Smithsonian Year*. SERIES COVER DESIGN: Seascape along the Atlantic coast of eastern North America.

Distribution of Recent Benthic Foraminifera in the Gulf of Mexico

*Stephen J. Culver
and Martin A. Buzas*

Introduction

Study of the recent benthic foraminifera in the Gulf of Mexico began in earnest in the early 1900s when Cushman published the first of several monographs on the foraminifera of the Atlantic Ocean. Since then, many other workers have contributed papers on the taxonomy, distribution, and ecology of Gulf of Mexico benthic foraminifera. Poag (1975) presented an abstract summarizing Circum-Gulf of Mexico distributions but a more detailed account was not published at the time of the writing of this paper. Between 1918 and 1978, 103 papers concerning Gulf of Mexico foraminifera were published. This paper represents the first attempt to synthesize these data and is the second of a series including and summarizing all published data on the distribution of recent benthic foraminifera around North America. All published distributional data for the east coast is presented in Culver and Buzas (1980) and the results of subsequent analysis are given in Buzas and Culver (1980), Culver and Buzas (in press, a; in press, b).

The work presented here can be divided into three main parts. First, there is a references sec-

tion consisting of (1) the 77 papers used in compiling the presence-absence data utilized by this study and (2) additional references that are cited in this paper. Second, there are five computer-generated catalogs listing every species ever recorded in publications on the Gulf of Mexico. Third, there are computer-generated maps of the 295 most commonly recorded species together with a map showing all sample localities in the Gulf. Explanatory notes for the catalogs and maps can be found later in this introduction. The discussion section contains tabulated summaries and treats various aspects of the distribution of individual species and groups of species.

Following the format of our study of the benthic foraminifera off the east coast of North America (Culver and Buzas, 1980), we have included a key to our concept of each of the 295 most commonly recorded species of the Gulf of Mexico.

METHODS

COMPUTER TECHNIQUES.—The computerization methods utilized in this work were the same as those described in detail in Culver and Buzas (1980).

DATA COMPILATION.—Of the 103 papers published on the benthic foraminifera of the Gulf of

Stephen J. Culver and Martin A. Buzas, Department of Paleobiology, National Museum of Natural History, Smithsonian Institution, Washington, D.C. 20560.

Mexico, 77 contained data in a form enabling their incorporation in this study. The name of one or more species (living or dead) and the locality where they were found was all that was required. The information entered in the basic compilation file consisted of (1) author of publication, (2) date of publication, (3) generic name used in publication, (4) specific name used in publication, (5) locality, (6) latitude and longitude (see "Catalog 1").

When numerous sample sites of a particular study were in very close proximity they were summarized by one or several representative localities. Thus, all species recorded in the sampled area were considered to have been found at the representative points. Modification and sorting of this basic data file resulted in the production of five catalogs that are described below. The 296 maps in this publication are also computer-generated and were drawn on a Calcomp Plotter.

THE CATALOGS

Five catalogs are included in this section and are designed to enable the reader to have rapid access to all published distributional data on recent benthic foraminifera in the Gulf of Mexico. Catalog 1 lists (alphabetically by binomen) all the records of every species ever recorded in the Gulf and includes publication and locality information. This catalog contains over 18,000 entries and over 90,000 pieces of information. Catalog 2 is the synonymized version of Catalog 1. This list is identical to Catalog 1 except that generic and specific names have been changed where necessary. To aid referral between Catalogs 1 and 2, line numbers starting at 10001 are included at the lefthand margin of the files. Thus, for example, it can be seen that *Borelis pulchra* from the Tortugas (Catalog 2, line 10118) was originally recorded (Cushman, 1922a) as *Alveolina pulchra* (Catalog 1, line 10118).

Catalogs 3 and 4 aid rapid use of the first two catalogs. Catalog 3 is an alphabetized list of the 1219 taxa that have been recorded in the Gulf of Mexico. Catalog 4 lists alphabetically the 848 species recorded in this area after synonymization

achieved by reference to published illustrations and to specimens lodged in the USNM collections (National Museum of Natural History, Smithsonian Institution) and the British Museum (Natural History) collections. Catalogs 3 and 4, therefore, are derived directly from Catalogs 1 and 2 respectively.

Catalog 5 is intended for the researcher interested in specific areas. This catalog contains alphabetized lists of synonymized species for each locality (localities are listed by increasing latitude and longitude). If, in the case of a synonymized species, the investigator questions the generic or specific name used, he can refer to Catalogs 1 and 2 to find the original name used by the author of the publication in which that species was recorded.

A compilation of this magnitude inevitably contains some errors. At this time we are aware of three that were discovered too late to correct. The records of *Plectina apicularis* in Catalog 1 should have been referred to *Karrieriella apicularis* in Catalogs 2, 4, and 5. These records, therefore, should be referred by the reader to the latter name in the synonymized catalogs. Similarly, the records of *Siphotrochammina squamata* in Catalog 1 should have been referred to *Trochammina squamata* in Catalog 2, 4, and 5. The maps drawn for the distribution of *Karrieriella apicularis* and *Trochammina squamata* are complete and correct. Both *Amphicoryna sublineata* and *Nodosaria sublineata* appear in Catalogs 2, 4, and 5, and a map has been included for each of them; however, reference to the key of commonly recorded species indicates that they are conspecific. Hence, the records shown on the two maps should be combined. Tables 1 and 3 refer to this species as *Nodosaria sublineata*.

THE MAPS

Two hundred and ninety-six computer-generated maps are included in this section and, like the catalogs, are provided as a reference tool for use in distributional studies of recent benthic foraminifera. Figure 1 illustrates the distribution of all the 426 sample localities included in this

study. The 183 m and 1830 m submarine contours roughly approximate the edge of the continental shelf and the bottom of the continental slope, respectively. The distribution of the sample localities must be taken into account when examining the maps illustrating the distributions of species.

Figures 2–296 are computer-generated maps for the 295 most commonly recorded species. These are species that have been recorded 16 times or more, or at approximately 4% or more of the 426 localities: the figure 4% was chosen to achieve conformity with the study of the Atlantic continental margin of North American (Culver and Buzas, 1980) where maps were drawn for those species that have been recorded 20 times or more, again approximately 4% or more of the 542 localities in question. The maps are arranged alphabetically by genera and by species within each genus. A brief discussion and tabulated summary of the distribution of each of the illustrated species follows.

ACKNOWLEDGMENTS

We thank Dante Piacesi and Ken McCormick for their considerable efforts in the computer production of this work. Angela Lanham and Laurel Smith contributed invaluable library research and secretarial services. James Ingle supplied the type specimens of several species for our examination and C. G. Adams allowed access to British Museum (Natural History) collections.

Discussion

The main purpose of this publication is to present all the published distributional data of the recent benthic foraminifera of the Gulf of Mexico. The discussion of these data, therefore, will be brief and of a summary nature as more detailed discussion will be the subject of subsequent publications.

A total of 1219 taxa have been recorded in the Gulf of Mexico from 426 localities. Synonymization has reduced this number to 848. Of these 848 species, 295 occurred at 16 or more of the 426

localities; that is, 35% of the species occur at 4% or more of the sample localities.

Distributional data of the 295 most commonly recorded species have been summarized by tabulation. Tables 1 and 2 present depth distribution and Table 3 is a synopsis of geographic distribution. Original analysis of depth distribution involved placing the species in three categories, coastal, less than 200 m, and more than 200 m. This clearly indicated species diversity increasing continuously offshore; however, much detailed information was lost in using only these three categories. Thus, the overlapping distribution categories in Table 1 more accurately convey depth distribution information for the 295 most commonly recorded species. Twenty-three species occur at depths of less than 50 m, 13 at less than 100 m, eight at less than 200 m, one between 50 and 200 m, 23 at less than 500 m, two between 50 and 500 m, 28 less than 1000 m, 13 between 50 and 1000 m, five between 100 and 1000 m, one between 200 and 1000 m, 11 at less than 2000 m, six between 50 and 2000 m, 16 between 200 and 2000 m, 16 between 500 and 2000 m, 31 at depths of more than 50 m, 13 deeper than 100 m, 37 deeper than 200 m, 18 deeper than 500 m, and 11 deeper than 1000 m. Eighteen species are ubiquitous.

No species are confined to depths of more than 2000 m. All species that occur deeper than 2000 m—those in the more than 50 m, 100 m, 200 m, 500 m, 1000 m, and ubiquitous categories in Table 1—range, therefore, from abyssal depths up onto the slope or shelf. Thus, a deep water association composed of solely abyssal species does not occur.

The depth range of species is very variable. *Marginulina planata* (Figure 160) has a very narrow range of 50 to 200 m, as do the 23 species listed in the less than 50 m category. By contrast, 18 species are ubiquitous from inner shelf to abyssal depths and a further 31 species are almost as eurybathyal, occurring at depths of more than 50 m.

Depth distributions of various organisms have been noted as changing with latitude (e.g., Hazel, 1970). Several species exhibit some changing of

depth distributions around the Gulf. The most distinct examples of these distributions are summarized in Table 2. The depth distribution noted for *Melonis pompilioides* (Figure 165) in this table and in Table 1 may be somewhat misleading. The shelf occurrences were recorded by Phleger (1951). In the associated taxonomic paper (Phleger and Parker, 1951) it was noted that shallower records were probably referable to *Nonion barleeianum* (= *Melonis barleeianus*) (Phleger and Parker, 1951:11). These authors, however, did not expressly state at what depth the compressed form, *M. barleeianus*, was replaced by the more inflated *M. pompilioides*. Thus, to preclude subjectivity in synonymization of species records at particular localities, all records of *Melonis pompilioides* in

shown in Table 2 to exhibit changing distributions around the Gulf of Mexico. Three species move into deeper water eastwards across the Gulf and one species occupies deeper habitats to both the south and east. *Textularia earlandi*, generally a coastal form both on the east coast of North America and in the Gulf of Mexico, clearly moves into deeper water off the Mississippi delta (Figure 258).

Comparisons of depth distributions for species occurring off more than one coast of North America will be the subject of a future publication. For the present, the reader is referred to the maps in this publication and in Culver and Buzas (1980) for comparison purposes.

Generic distributions may also provide useful depth information. For example, in the Gulf of Mexico, most species of the genus *Elphidium* occur

shallower than 500 m. The genus *Bigenerina* is also restricted to depths of less than 500 m and *Buliminella* species occur shallower than 1000 m. The genus *Francesita* (represented by one species) is indicative of deep water, occurring at more than 1000 m depth. In contrast, species of the genus *Quinqueloculina* are not so restricted: of a total of 14 species, 8 occur at depths of less than 100 m, 12 shallower than 1000 m, while another species (*Q. vulgaris*, Figure 216) is only found deeper than 500 m and *Q. venusta* (Figure 215) is restricted to depths of greater than 1000 m. Thus, as expected, generic distributions are of some use as depth indicators but are not so applicable as individual species distributions.

Consideration of the depth distribution of benthic foraminifera as described here must take into account the limitations of the sample frame-

work as defined in Figure 1. Data are lacking for the deepest part of the Gulf and for the Campeche Shelf. So much information is available, however, for the northern half of the Gulf of Mexico that the species depth distributions given herein are almost certainly representative of the Gulf as a whole.

Geographic distribution of recent benthic foraminifera is the subject of Table 3. Visual examination of Figures 2-296 suggests 11 categories of distribution. Five species are restricted to the northeastern part of the Gulf, 13 species occur in the northeastern to northcentral area, 14 species are restricted to the northcentral segment, 54 species occur across the Gulf in northeast, northcentral, and northwest segments, 44 species occur in the northcentral to northwest area, seven species are restricted to the northwestern part of the Gulf, four species occur in northeast, northcentral, and southern areas, two species occur in northeastern and southern areas, and six species occur in northcentral, northwest, and southern segments of the Gulf. Four species exhibit a disjunct distribution occurring in the northeast and northwest parts of the Gulf but not in the northcentral area, and 141 species have a ubiquitous, around-the-Gulf, geographic distribution.

The species comprising each category in Table 3 are generally restricted to the geographic area under which they are listed. Thus, a list of all the species that have been recorded in the northwest part of the Gulf of Mexico would include those listed under that particular category ("Northwest") plus those listed under the headings "Northeast-Northcentral-Northwest," "Northcentral-Northwest," "Northcentral-Northwest-South," "Northeast-Northwest," and "Ubiquitous." To save lengthy and repetitive description, the reader is referred to the relevant maps that illustrate these areas.

Zoogeography of the Gulf of Mexico has been the subject of several papers (e.g., Dall, 1889; Hedgpeth, 1953; Pulley, 1953). These papers are based on marine macrofaunal distributions and, as far as the authors know, benthic foraminiferal provinces in the Gulf of Mexico have not been discussed in print. The results of the present study, summarized in Tables 1-3, and prelimi-

nary cluster analysis suggest that provincial boundaries in the Gulf of Mexico can be distinguished only at particular depths or at physiographic boundaries. The large number of geographically ubiquitous species (Table 3) in shelf and slope areas suggests that any chemical and physical environmental changes laterally around the Gulf or at the Mississippi delta are not large enough to promote provincialism. The most recognizable lateral geographic restriction of species that can be related to provincialism is the occurrence of the larger miliolids *Archaias angulatus* (Figure 22), *Sorites orbitolitooides* (Figure 250) and *Peneropolis proteus* (Figure 185), and *Gypsina vesicularis* (Figure 134) generally in the eastern part of the Gulf of Mexico. These records probably represent westward migration (now or in the recent past) from highly carbonate Caribbean environments where they abound.

Benthic foraminiferal provinces in the Gulf of Mexico are being investigated using the same techniques as were used for the eastern continental margin off North America (Buzas and Culver, 1980; Culver and Buzas, in press, a).

Summary

1. All published data on the distribution of recent benthic foraminifera in the Gulf of Mexico are presented in the form of 5 catalogs and 296 maps.

2. 1219 taxa have been recorded in the area of study.

3. The taxa have been reduced to 848 by synonymization.

4. Of the 848 synonymized species, 295 occurred at 16 or more of the sample locations; that is, 35% of the species occur at 4% or more of the 426 sample localities.

5. Nineteen groups of commonly recorded species characterize overlapping depth zones.

6. Another group of species is ubiquitous to all depths.

7. Commonly recorded genera and species vary in their usefulness for delimiting depth zones.

8. The depth distribution of 14 commonly recorded species changes considerably around the

Gulf of Mexico and one species moves into deeper environments off the Mississippi delta.

9. Ten groups of commonly recorded species characterize overlapping zoogeographic categories.

10. Another group, represented by 141 of the 295 commonly recorded species, is ubiquitous in its geographic distribution in the area of study.

11. Foraminiferal provincial boundaries cannot be distinguished laterally around the Gulf, as circum-Gulf of Mexico physical and chemical environmental changes at any given depth are probably not large enough to promote provincialism.

Key to the Species on the Maps

Following Culver and Buzas (1980) we list below a key to our concept of the 295 most commonly recorded species in the Gulf of Mexico. Genera are listed alphabetically as are the species within each genus. Under each species, the reference or references are given where the reader can find published illustrations that adequately convey our concept of each of the commonly recorded species in this study. Many of the 295 species were also included in the key to commonly recorded species for the east coast of North America (Culver and Buzas, 1980); the references given here for these species are generally the same.

REQUIREMENTS FOR SMITHSONIAN SERIES PUBLICATION

Manuscripts intended for series publication receive substantive review within their originating Smithsonian museums or offices and are submitted to the Smithsonian Institution Press with approval of the appropriate museum authority on Form SI-36. Requests for special treatment—use of color, foldouts, casebound covers, etc.—require, on the same form, the added approval of designated committees or museum directors.

Review of manuscripts and art by the Press for requirements of series format and style, completeness and clarity of copy, and arrangement of all material, as outlined below, will govern, within the judgment of the Press, acceptance or rejection of the manuscripts and art.

Copy must be typewritten, double-spaced, on one side of standard white bond paper, with 1¼" margins, submitted as ribbon copy (not carbon or xerox), in loose sheets (not stapled or bound), and accompanied by original art. Minimum acceptable length is 30 pages.

Front matter (preceding the text) should include: **title page** with only title and author and no other information, **abstract page** with author/title/series/etc., following the established format, **table of contents** with indents reflecting the heads and structure of the paper.

First page of text should carry the title and author at the top of the page and an unnumbered footnote at the bottom consisting of author's name and professional mailing address.

Center heads of whatever level should be typed with initial caps of major words, with extra space above and below the head, but with no other preparation (such as all caps or underline). Run-in paragraph heads should use period/dashes or colons as necessary.

Tabulations within text (lists of data, often in parallel columns) can be typed on the text page where they occur, but they should not contain rules or formal, numbered table heads.

Formal tables (numbered, with table heads, boxheads, stubs, rules) should be submitted as camera copy, but the author must contact the series section of the Press for editorial attention and preparation assistance before final typing of this matter.

Taxonomic keys in natural history papers should use the aligned-couplet form in the zoology and paleobiology series and the multi-level indent form in the botany series. If cross-referencing is required between key and text, do not include page references within the key, but number the keyed-out taxa with their corresponding heads in the text.

Synonymy in the zoology and paleobiology series must use the short form (taxon, author, year:page), with a full reference at the end of the paper under "Literature Cited." For the botany series, the long form (taxon, author, abbreviated journal or book title, volume, page, year, with no reference in the "Literature Cited") is optional.

Footnotes, when few in number, whether annotative or bibliographic, should be typed at the bottom of the text page on which the reference occurs. Extensive notes must appear at the end of the text in a notes section. If bibliographic footnotes are required, use the short form (author/brief title/page) with the full reference in the bibliography.

Text-reference system (author/year/page within the text, with the full reference in a "Literature Cited" at the end of the text) must be used in place of bibliographic footnotes in all scientific series and is strongly recommended in the history and technology series: "(Jones, 1910:122)" or ". Jones (1910:122)."

Bibliography, depending upon use, is termed "References," "Selected References," or "Literature Cited." Spell out book, journal, and article titles, using initial caps in all major words. For capitalization of titles in foreign languages, follow the national practice of each language. Underline (for italics) book and journal titles. Use the colon-parentheses system for volume/number/page citations: "10(2):5-9." For alinement and arrangement of elements, follow the format of the series for which the manuscript is intended.

Legends for illustrations must not be attached to the art nor included within the text but must be submitted at the end of the manuscript—with as many legends typed, double-spaced, to a page as convenient.

Illustrations must not be included within the manuscript but must be submitted separately as original art (not copies). All illustrations (photographs, line drawings, maps, etc.) can be intermixed throughout the printed text. They should be termed **Figures** and should be numbered consecutively. If several "figures" are treated as components of a single larger figure, they should be designated by lowercase italic letters (underlined in copy) on the illustration, in the legend, and in text references: "Figure 9b." If illustrations are intended to be printed separately on coated stock following the text, they should be termed **Plates** and any components should be lettered as in figures: "Plate 9b." Keys to any symbols within an illustration should appear on the art and not in the legend.

A few points of style: (1) Do not use periods after such abbreviations as "mm, ft, yds, USNM, NNE, AM, BC." (2) Use hyphens in spelled-out fractions: "two-thirds." (3) Spell out numbers "one" through "nine" in expository text, but use numerals in all other cases if possible. (4) Use the metric system of measurement, where possible, instead of the English system. (5) Use the decimal system, where possible, in place of fractions. (6) Use day/month/year sequence for dates: "9 April 1976." (7) For months in tabular listings or data sections, use three-letter abbreviations with no periods: "Jan, Mar, Jun," etc.

Arrange and paginate sequentially EVERY sheet of manuscript—including ALL front matter and ALL legends, etc., at the back of the text—in the following order: (1) title page, (2) abstract, (3) table of contents, (4) foreword and/or preface, (5) text, (6) appendixes, (7) notes, (8) glossary, (9) bibliography, (10) index, (11) legends.
