Abstract

During the preparation of the Vascular Flora of the Marquesas Islands three new species of Cyrtandra (Gesneriaceae) have come to light and are described herein: C. uapouensis W. L. Wagner & Lorence, C. uahukaensis W. L. Wagner & Lorence, and C. kenwoodii W. L. Wagner & A. J. Wagner. Amended descriptions of the eight previously described Marquesan species are also provided as well as a key to the species. With the description of these the new species Cyrtandra in the Marquesas Islands consists of 11 species, six of which have been included in recent molecular phylogenetic studies of Pacific Cyrtandra, and appear to have arisen from one original introduction. If the other five species are members of this Marquesas clade then Cyrtandra would represent the largest lineage of Marquesas vascular plants. Psychotria is largest genus in the Marquesas Islands with 13 species, but is thought to consist of three separate lineages.

Introduction

Cyrtandra J.R. Forster & G.F. Forster (Gesneriaceae) is a genus of about 650 species with a paleotropical distribution from Southeast Asia and throughout the Pacific islands (Atkins et al. in press). Cyrtandra represents approximately 15–20% of the species within the family Gesneriaceae, and is a major component of the Old World members
of the family, which are members of subfamily Cyrtandroideae Endlicher (Burtt and Wiehler 1995). The greatest concentration of species is in the Malesian region where 450 to 600 species occur (Atkins et al. in press). Cyrtandra species form a conspicuous component of the understory in forests across this vast region. Although the genus is readily dispersed, occurring on virtually all archipelagoes across the Pacific islands to the remote Hawaiian Islands, most species are local endemics, with distributions on one island or occasionally on several within a single archipelago. Recent phylogenetic studies of Cyrtandra (Burtt 2001; Cronk et al. 2005; Clark et al. 2008, 2009) support a Southeast Asian origin of the genus, with subsequent dispersal and diversification throughout the Pacific. These studies identify a single strongly supported Pacific oceanic island clade that dates back ±22 million years (Clark et al. 2009).

Brown (1935) described the first species of Cyrtandra from the Marquesas Islands in his Gesneriaceae treatment for the Flora of Southeastern Polynesia. In the treatment he recognized four species (C. feaniana, C. ootensis, C. nukuhivensis, and C. toviana), all currently recognized here, but both C. ootensis and C. nukuhivensis with modified delimitations. Brown also described a fifth species, C. jonesii, but placed it in a new genus, Cyrtandroidea, which he erroneously believed to be a member of the Campanulaceae. Gillett (1973) provided an updated revision of the Marquesas species as part of a reconsideration of the south Pacific species. He recognized the same five species as Brown and made the combination for Cyrtandroidea jonesii to bring it properly into the genus as Cyrtandra jonesii. Fosberg and Sachet (1981) in their revision of Marquesan Cyrtandra maintained all five species. They also added three more species revealed by then recent collecting (C. tahuatensis, C. revoluta) and by a new interpretation of collections from Nuku Hiva considered by Gillett to represent C. jonesii (now C. thibaultii). Collecting in the Marquesas Islands intensified greatly with the initiation of the current Vascular Flora of the Marquesas Islands project under the direction of Warren L. Wagner and David H. Lorence (Lorence and Wagner 2011; Wagner and Lorence 1997) resulting in discovery of two additional species (C. uahukaensis, C. kenwoodii) and a reinterpretation of C. nukuhivensis to exclude the Ua Pou populations as C. uapouensis, bringing the total to 11 species in the Marquesas Islands (Table 1).

The Marquesas Island species form a weakly supported clade in the recent maximum likelihood molecular analyses (Clark et al. 2009) with six of the 11 species sampled. Figure 1 presents a portion of the overall tree with the Marquesas species and the sister group to them from Clark et al. (2009). The Marquesas species are divided into two major strongly supported clades with one outlier, C. kenwoodii from Ua Pou, that is unplaced in a polytomy with the other two clades. The two primary clades in the molecular analysis are corroborated by morphology: species with calyx divided nearly to the base forming one clade (with all three species sampled, C. feaniana, C. ootensis, and C. tahuatensis), and the species with plicate calyx, which are divided less than ¾ of their length forming the second clade (with only C. jonesii and C. thibaultii sampled). Within the divided calyx clade there are three samples of C. tahuatensis. They do not

form a clade but rather the two samples from Tahuata form a clade sister to a polytomy of the Fatu Hiva sample and the single samples of the other two species. Several of the unique Marquesas species were not included, especially the peltate-leaved C. toviana and the revolute-leaved C. revoluta, in the analyses so that a conclusion of a single introduction for all of the species cannot be substantiated until there has been further sampling and perhaps more variable sequence data added since support for some parts of the clade are not robust (Clark et al. 2009). The plicate calyx clade occurs on the older islands of the Northern Marquesas group (Nuku Hiva, Ua Huka, and Ua Pou) while the divided calyx clade occurs primarily on the younger islands of the southern group (Hiva Oa, Tahuata, and Fatu Hiva)(see Fig. 2 for Map of the the Marquesas Islands). There are a few collections of the divided calyx clade from the older islands, all of which were collected by the Pacific Entomological Survey in 1929–1930. If the
locality information on the labels of these collections is correct, the species of the divided calyx clade appear to no longer occur on the older islands.

When evaluated using the IUCN Red list categories and criteria for threatened species version 3.1 (IUCN 2001, see also http://www.iucnredlist.org/static/categories_criteria_3_1), all 11 of the Marquesan species of *Cyrtandra* fall into the Endangered (EN) or Critically Endangered (CR) categories, which designate species facing the highest risk of extinction in the wild. Marquesan species of *Cyrtandra* meet the IUCN criteria by having known ranges less than 100 km², an area of occupancy of less than 10 km², and continuing decline in the quality of habitat across the Marquesas Islands (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).
All measurements given herein are taken from dried herbarium specimens, although certain features such as shapes were supplemented with information from alcohol-preserved flowers and fruits, field notes, and color slides or digital photos. Measurements are presented in the descriptions as follows: length × width, followed by units of measurement (mm or cm). Specimens from the following herbaria were studied: AD, BISH, BKL, CBG, CHR, E, HAST, K, L, MO, MPU, NSW, NY, P, PAP, PTBG, S, UC, US, and WU. Many of the Marquesas Cyrtandra species are very narrowly distributed so distribution maps would not be especially useful so we provide here (Fig. 2) a map of the Marquesas Islands to show the islands and their relationship to one another.

**Taxonomic part**

Artificial key to species of Marquesas Cyrtandra

1. Leaves suborbicular, peltate.......................... *C. toviana*
   – Leaves elliptic, elliptic-oblanceolate or lanceolate, not peltate ...................2

2. Leaves strongly revolute.......................... *C. revoluta*
   – Leaves flat or very inconspicuously revolute ........................................3

3. Plant less than 1 m tall; leaves 1–2.1 cm wide ............... *C. kenwoodii*
   – Plant (1–) 2–5 m tall; leaves (1.3–)5 –25 cm wide ...................................4

4. Calyx divided less than 3/4 the way to the base, plicate..............5
   – Calyx divided nearly to the base, not plicate ...........................................9

5. Leaves rugose, 26–40 × 10–25 cm; bracts rhombic, 18–20 mm.... *C. jonesii*
   – Leaves not rugose, 14–29 × 5–13 cm; bracts triangular, 3–11 mm ...........6

6. Inflorescence 14–30 cm; peduncles 80–90 mm; calyx 25–45 mm............. *C. thibaultii*
   – Inflorescence 0–7 cm; peduncles 0–35 mm; calyx 15–25 mm ......................7

7. Lower surface of leaves densely dark ferruginous pubescent ... *C. uahukaensis*
   – Lower surface of leaves pale ferruginous pubescent when young, glabrate or pubescent primarily along veins on lower surface at maturity..............8

8. Leaves elliptic, occasionally elliptic-oblanceolate, 14–24.5 × 5–7.5 cm; calyx 15–23 mm.......................................................... *C. nukubivensis*
   – Leaves elliptic-oblanceolate to elliptic, 19–28 × 8–13 cm; calyx 20–25 mm.. .......................................................... *C. uapouensis*

9. Plants glabrous, or occasionally with a few scattered hairs ........ *C. feaniana*
   – Plants pubescent, at least on the youngest parts of the plant ..................10

10. Plant densely ferruginous pubescent; peduncles 2–3 mm in diameter .............. *C. tabuatensis*
    – Plant sparsely to moderately whitish to ferruginous pubescent; peduncles 1–2 mm in diameter .......................................................... *C. ootensis*
Plicate calyx group

Fig. 3

**Description.** Shrubs 2–6 m. Leaves opposite, borne on upper 2–5 nodes, leathery when fresh, drying chartaceous, broadly elliptic to broadly elliptic-oblanceolate, 26–40 × 10–25 cm, rugose, upper surface glossy, green, sparsely pubescent when young, especially along major veins, quickly glabrate, lower surface pale green, moderately ferruginous appressed pubescent, especially along major veins, quickly glabrate, margins irregularly serrate-dentate, apex broadly rounded, ± with an often long, acuminate tip, base broadly rounded, truncate or abruptly attenuate, petioles 2.5–7.0 cm long. Flowers in loose, open cymes 8–20 cm long, basally cauliflorous on the main stem, cymules 1–3 flowered, peduncles up to 30 mm long, ca. 3–4 mm in diameter, pedicels 0–1 mm, bracts rhombic, whitish brown, 18–20 mm, soon deciduous; calyx funnelform, whitish brown, plicate, 33–46 mm long, the lobes 10–20 mm long, unequal, triangular, sparsely minutely appressed pubescent, appearing glabrate, deciduous after anthesis; corolla white, tube funnelform, 40–50 mm long, slightly exceeding the calyx, lobes suborbicular, 8–15 mm long; style ca. 7 mm long, glabrous or with a few scattered hairs. Mature berry unknown, but young ones ovoid, ca. 10 mm long.

**Distribution.** Marquesas Islands, endemic to Ua Huka, scattered in Hitikau area to Vaikivi summit and drainage, from 500 to 870 m. One collection (Mumford & Adamson 561, BISH) made in 1929 is from Nuku Hiva, but it is possible that the locality on the label is incorrect and the plant was actually collected on Ua Huka, where Adamson was for four days in October 1929 (N. Evenhuis, pers. comm. May 2013).

**Ecology.** *Cyrtandra jonesii* is known only in montane wet shrubland with *Freyci-netia impavida* (Gaudich. ex Hombr.) B. C. Stone and *Hibiscus tiliaceus* L. dominant.

**Conservation status.** IUCN Red List Category: Endangered EN B1ab (i,ii,iii) + 2ab (i,ii,iii): B2: total area of occupancy less than 5000 km² (ca. 423 km²). B1a, severely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra jonesii* on Ua Huka (ca. 83 km²) and possibly on Nuku Hiva (ca. 340 km²), is restricted to mountain slopes and summits, indicated as an endangered environment that is threatened by human activity (deforestation and fire), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-

Dombois and Fosberg 1998; Meyer and Salvat 2009). If this species is restricted to only Ua Huka, then its conservation status would be CR.

**Specimens examined.** Marquesas Islands. Nuku Hiva: Puokohe, 3500 ft [1067 m], 22 October 1929, Mumford 561 (BISH, S). Ua Huka: Hitikau region, ascended via the Matukuoha Ridge over-looking Hane, constitutes the summit of the single crater of Ua Huka, 730 m, UTM 0661697 – 9015668, 5 Dec 2003, Wood 10493 (PTBG), 780 m, Wood 10474, (PTBG), 700 m, Wood 10484 (PTBG); summit of Hitikau area, 872 m, 8°54’30.6”S, 139°31’46.9”W, 15 June 2004, Perlman & Wood 19017 (PTBG, US); Hitikau summit area, 686 m, 8°54’19.7”S, 139°31’7.3”W, 26 July 2005, Perlman & Meyer 19741 (BISH, P, PAP, PTBG, US); Hitikau and the Vaikivi summit region, 870 m, 8°54’40.5”S, 139°31’32.5”W, 14-15 June 2004, Wood & Perlman 10744 (PAP, PTBG, US); Vaikivi summit region and drainage, boulder-strewn stream-bed running south and west below Hitikau, 700 m, 8°54’S, 139°31’W, 14–15 June 2004, Wood & Perlman 10751 (PTBG).

**Discussion.** Brown described the genus *Cyrtandroidea* for this species in the Campanulaceae, but Gillett (1973) effectively placed the generic name in synonymy when he transferred it to *Cyrtandra*. Gillett, however, did not recognize that the second syntype, Quayle 1243 (BISH) represented another species, subsequently described by Fosberg and Sachet (1981) as *C. thibaultii*. Fosberg and Sachet pointed out that Gillett’s description of *C. jonesii* was based primarily on his own collection of the then undescribed *C. thibaultii*. Here we have revised the description, based on new collections and on the description from original material provided by Fosberg and Sachet (1981).

http://species-id.net/wiki/Cyrtandra_nukuhivensis
Fig. 4

**Type.** Marquesas Islands: Nuku Hiva: Rain forest, 800 m, September 1922, E.H. Quayle 1233 [1293] (holotype: BISH-509954!; isotypes: BISH!, BKL).

**Description.** Shrubs (1.5–) 2–5 m tall; stems usually few. Leaves opposite, borne on upper 4–8 nodes, elliptic, occasionally elliptic-oblanceolate, 14–24.5 × 5–7.5 cm, glabrate, upper surface glossy, dark green, lower surface pale green, margins serrulate, apex rounded and usually with acuminate tip, base attenuate, petioles 3–6 cm. Flowers in congested cymes 2.0–7 cm arising in the upper leaf axils, flowers 1–9, ferruginous pubescent, quickly glabrate, peduncles 10–35 mm long, ca. 1–2 mm in diameter, pedicels 2–18 mm, bracts triangular, ca. 3–5 mm; calyx ellipsoid, white, plicate, 15–23 mm long, the lobes 6–11 mm long, deciduous after anthesis; corolla broadly funnelform, tube ca. 22–30 mm, slightly exceeding the calyx, the lobes ca. 8–10 mm long; style ca. 3 mm long, pubescent. Young berry cylindrical-ovoid, 10–18 mm long.

**Distribution.** Marquesas Islands, uncommon, endemic to Nuku Hiva, Toovii Plateau to Mt. Ooumu, from 800 to 1150 m.
**Ecology.** *Cyrtandra nukuhivensis* is known from montane wet forest with *Metrosideros collina* (J. R. Forst. & G. Forst.) A. Gray and *Weinmannia marquesana* F. Br. forest with diverse fern understory along with other shrubs and trees such as species of *Cheirodendron, Coprosma, Crossostylis, Ilex, Melicope,* and *Xylosma.*
Conservation status. IUCN Red List Category: Endangered EN B1ab (i,ii,iii) + 2 ab (i,ii,iii): B2: total area of occupancy less than 5000 km² (ca. 340 km²). B1a, severely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra nukuhivensis* on Nuku Hiva (ca. 340 km²), is restricted to mountain slopes and summits, indicated as an endangered environment that is threatened by human activity (deforestation and fire), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

Specimens examined. Marquesas Islands. Nuku Hiva: Toovii, 800 m, Quayle 1293 (BISH [2]); Toovii, flanc N de l’épaulement SE du Mt. Ooumu, 960 m, 29 May 1984, Florence 6851 (BISH, P); Toovii, épaulement S du Mt. Ooumu, 930 m, 8°51'S, 140°8’W, 8 December 1982, Florence 4337 (BISH [2], K, NY, P, US); Toovii, flanc SE du Mt. Ooumu, 1020 m, 8°50’S, 140°09’W, 11 March 1986, Florence 7523 (BISH, US); Toovii Plateau, spur of Mt. Ooumu, 950 m, 18 July 1977, Gagné 1104 (BISH) Gagné 930 m, 1105 (BISH, US); Toovii Plateau, l’Economie Rurale, summit, above new road, on crest, 1152 m, 16 July 1988, Perlman, Wagner, Lorence & Fosberg 10100 (BISH, E, MO, PAP, PTBG, US); ravine en forêt de Toovii, 2 March 1973, Hallé 2073 (US); between Taiiohae Bay and Hooumi Bay, 900 m, 20 July 1977, Gagné & Montgomery 1160 (BISH); S slope of Mt. Tapuaaoa, 10 July 1970, Gillett 2178 (BISH, US); Mt. Ooumu, 3500 ft, 28 March 1960, Decker 376 (BISH, US [2]); Toovii, Ooumu area, top of Tapueahu Valley off new hwy, 1067–1128 m, 8°51’S, 140°19’W, 20–22 September 1995, Wood & Perlman 4626, (PAP, PTBG, US, WU); Ooumu area, top of Tapueahu Valley off new Hwy, 1067–1128 m, 8°51’53”S, 140°10’6.3”W, 23 June 1997, Wood, Meyer, Luce & Tetuanui 6340 (PTBG); summit of ridge S of Tekao, 0.5 mile N New Airport Road, between Airport Road & Tekao, main ridge above Toovii, 1128 m, 25 September 1995, Perlman & Wood 15060 (BISH, P, PAP, PTBG, US, WU); along new Airport road, along summit crest above Toovii, Peak #1227 M., summit of Mts. S of Tekao, 1122 m, 22 September 1995, Perlman & Wood 15034 (BISH, MO, P, PAP, PTBG [2], US, WU).

Discussion. *Cyrtandra nukuhivensis* is delimited in a more restricted way than previously and is here considered to be endemic to Nuku Hiva. The Ua Pou plants are here considered a distinct, but closely related species.

Fig. 5

**Type.** Marquesas Islands: Nuku Hiva: Toovii, 850–900 m, 9 July 1975, J.-C. Thibault 134 (holotype: US-02969235!; isotype: US!).

**Description.** Shrubs 2–5 m. Leaves opposite, borne on upper 4–8 nodes, oblong-elliptic to elliptic, 16–29 × 6.5–13 cm, upper surface glabrate or ferruginous pubescent on veins, lower surface densely or moderately ferruginous pubescent, apex acuminate,

base cuneate, petioles 2–6 cm long, appressed ferruginous pubescent. Flowers in open, 
loose cymes, 14–30 cm long, arising in the upper leaf axils, appressed ferruginous pu-
bescent, peduncle 80–90 mm long, ca. 1–2 mm in diameter, pedicels 10–15 mm, elon-
gating to 25–30 mm in fruit, bracts triangular, ca. 6–11 mm; calyx cylindrical-ellipsoid,
pale green, plicate, 25–45 mm long, appressed ferruginous pubescent, lobes 5–17 mm 
long, deciduous after anthesis; corolla funnelform, tube 25–50 mm long, lobes about 
15–20 mm long; style 10 mm long, appressed to spreading pubescent. Berry fusiform, 
ca. 45 mm long. Seeds broadly elliptic or ovoid, 0.3-0.4 mm long, reticulate.

**Distribution.** Marquesas Islands, scattered, on Nuku Hiva from the Toovii Pla-
teau to Mt. Ooumu, and on Ua Pou from Oave, Teavahaakiti, and Pouakei, from 700 
to 1050 m.

**Ecology.** *Cyrtandra thibaultii* is known from *Metrosideros collina*, *Weinmanna 
maresana*, and *Freycinetia impavida* forest with an association with diverse shrubs 
and trees such as species of *Cheirodendron*, *Coprosmia*, *Crossostylis*, *Hernandia*, *Ilex*,
*Melicope*, *Psychotria*, *Trimenia*, and *Xylosma*.

**Conservation Status.** IUCN Red List Category: Endangered EN B1ab (i,ii,iii) +
2 ab (i,ii,iii). B2: total area of occupancy less than 5000 km² (ca. 445 km²). B1a, se-
verely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat 
for *Cyrtandra thibaultii* on Nuku Hiva (ca. 340 km²) and Ua Pou (ca. 105 km²), is 
restricted to mountain slopes and summits, indicated as an endangered environment 
that is threatened by human activity (deforestation and fire), feral animals, and inva-
sive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-
Dombois and Fosberg 1998; Meyer and Salvat 2009).

Revision of *Cyrtandra* (Gesneriaceae) in the Marquesas Islands

Oave, 792 m, 9°23′7.7″S, 140°4′W, 22 July 2005, Perlman 19730 (P, PAP, PTBG, US); forested ridge and slopes up to Pouakei, northwest side, 930 m, 9°24′S, 140°5′W, 21 Nov 2003, Wood 10428 (PTBG, US); forested ridge and slopes up to Teavahaakiti, northwest side, 914 m, 24 Nov 2003, Wood 10449 (PTBG, US).

**Discussion.** The sample used (Wood 10428) in the molecular study by Clark et al. (2009) was identified as *C. nukuhivensis*, but during this taxonomic revision it was re-identified as the closely related *C. thilbaultii*.

4. **Cyrtandra uahukaensis** W. L. Wagner & Lorence, sp. nov.

urn:lsid:ipni.org:names:77134229-1
http://species-id.net/wiki/Cyrtandra_uahukaensis

Fig. 6

**Description.** Shrubs 1-2 m tall; stems apparently few. Leaves opposite, borne on upper 2–5 nodes, broadly elliptic, 18–26 × 7–10 cm, lower surface densely ferruginous appressed pubescent, upper surface glabrate, irregularly dentate, the teeth variable in size, petiole 5–6.5 cm, ferruginous appressed to spreading pubescent. Flowers in cymes arising in the upper leaf axils, apparently 1–3 flowered, peduncle 0–2 mm, ca. 1–2 mm in diameter, pedicels up to 6 mm; calyx cylindrical-ellipsoid, white, plicate; corolla much longer than calyx; style up to 10 mm, flower parts otherwise unknown. Partly mature berries up to 14 mm long.

**Distribution.** Marquesas Islands, rare, endemic to Hitikau summit area, Ua Huka, from 820–870 m.

**Ecology.** *Cyrtandra uahukaensis* is known only from Freycinetia impavida - *Hibiscus tiliaceus* shrubland.

**Etymology.** The specific epithet refers to the island of Ua Huka where the only known populations occur.

**Conservation status.** IUCN Red List Category: Critically Endangered CR B2a + 2b (i, ii, iii). B2: total area of occupancy less than 10 km² (ca. 5 km²). B2a, a single population known; b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra uahukaensis* on Ua Huka (ca. 83 km²) is indicated as an endangered environment, threatened feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined.** **Marquesas Islands.** Ua Huka: 13 May 1918, Henry 7 (P); Hitikau summit region, large bowl-like plateau, 823–884 m, 8°54′22″S, 139°31′66″W, 28 June 1997, Wood 6380 (PTBG); Hitikau and the Vaikivi summit region, 790 m, 8°54′S, 139°31′W, 14–15 June 2004, Wood & Perlman 10756 (PTBG).

**Discussion.** Little is known about this species as it has been collected only four times. None of the collections were preserved with any flowers, only young fruit.
Figure 6. *Cyrtandra ualukaensis* W. L. Wagner & Lorence (Perlman et al. 15844, isotype US).
Cyrtandra uahukaensis is characterized by the densely pubescent leaves and condensed inflorescences. It grows in the same area as C. jonesii and appears to be closely related. Their relationships and ecology should be studied as it seems atypical for two very closely related species of the genus to grow in near sympatry.

5. Cyrtandra uapouensis W. L. Wagner & Lorence, sp. nov.
urn:lsid:ipni.org:names:77134230-1
http://species-id.net/wiki/Cyrtandra_uapouensis
Fig. 7

**Type.** Marquesas Islands: Ua Pou: Ridge just north of Oave, between Oave and Matahenua, high mountain peaks along main backbone ridge, 945 m, 9°23'455"S, 140°4'433"W, 3 July 2004, S. P. Perlman & K. R. Wood 19085 (holotype: PTBG-042428!; isotypes: BISH!, MO, NY, P, PAP, US!).

**Description.** Shrubs 1.5–3 m tall; stems usually few. Leaves opposite, borne on upper 3–5 nodes, elliptic-oblanceolate to elliptic, 19–28 × 8–13 cm, upper surface glossy, dark green, glabrate, lower surface pale green, ferruginous pubescent when young, when maturing pubescent primarily along the veins, margins serrulate, apex rounded and usually acuminate, base attenuate, petioles 4.5–7 cm. Flowers in congested cymes 1–3 cm long arising in the upper leaf axils, flowers 1–6, ferruginous pubescent, quickly glabrate, peduncles 3–15 mm long, ca. 1–2 mm in diameter, pedicels 0–10 mm, bracts triangular, ca. 8–11 mm; calyx ellipsoid, white, plicate, 20–25 mm long, the lobes 8–13 mm long, deciduous after anthesis; corolla broadly funnelform, tube ca. 22–35 mm, slightly exceeding the calyx, the lobes ca. 8–10 mm long; style ca. 3 mm long, pubescent. Young berry ellipsoid-ovoid, 15–25 mm long.

**Distribution.** Marquesas Islands, rare, endemic to high ridges of Ua Pou, from Oave, Matahenua, Teavahaakiti, Tekahuipu, and Tekohepu, 680–945 m.

**Ecology.** Cyrtandra uapouensis is known only in Metrosideros collina – Weinmannia marquesana wet forest with diverse fern understory and other shrubs and trees such as species of Cheirodendron, Coprosma, Crossostylis, Ilex, Melicope, and Xylosma.

**Etymology.** The specific epithet refers to the island of Ua Pou where the only known populations occur.

**Conservation status.** IUCN Red List Category: Critically Endangered CR B2a + 2b (i, ii, iii). B2: total area of occupancy less than 10 km² (ca. 5 km²). B2a, a single population known; b (i–iii), habitat continuing decline inferred. The suitable habitat for Cyrtandra uapouensis on Ua Pou (ca. 105 km²) is indicated as an endangered environment, threatened feral animals and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined. Marquesas Islands. Ua Pou:** Mt. Tekahoipu, 800 m, 9 September 1922, Quayle 1151 (BISH); crête sud menant au mont Teavahaakiti, val- lon à pente forte, zone semi-ouverte, 810 m, 20 Jun 2004, Meyer 2847 (P, PAP, PTBG, US); Teavahaakiti, steep slopes of main ridge to S of Oave, N & E facing cliffs

between Teavahaakiti & Tekohepu, 683 m, 5 July 1997, Perlman & Wood 15904 (MO, P, PAP, PTBG, US, WU).

**Discussion.** Gillett (1973) included the only known specimen of Cyrtandra uapouensis at that time (Quayle 1151) within his delimitation of *C. nukuhivensis*; populations from Ua Pou are here separated based on its occurrence on a different island and its consistently larger leaves. *Cyrtandra uapouensis* grows sympatrically with *C. kenwoodii*, and there are several collections (cited in hybrid section) that are morphologically intermediate between them that appear to represent hybrids. The fact that *C. kenwoodii* forms a separate branch in the phylogenetic analyses (Clark et al. 2009; fig. 1) from both the divided calyx group and the plicate calyx group suggests that perhaps this hybridization has impacted the genome of *C. kenwoodii* or that the species is of hybrid origin.

**6. Cyrtandra kenwoodii** W. L. Wagner & A. J. Wagner, sp. nov.  
urn:lsid:ipni.org:names:77134231-1  
http://species-id.net/wiki/Cyrtandra_kenwoodii

**Fig. 8**

**Type.** Marquesas Islands: Ua Pou: Tekohepu, windswept and cloud-shrouded summit, shrubland of *Metrosideros collina* with *Dicranopteris linearis, Pae sia rugulosa, Freycinetia, Blechum, Oleandra sibbaldii*, and *Sellig e a feeioides*, 2500-3000 ft [762–914 m], 4–5 July 1997, K. R. Wood & S. Perlman 6467 (holotype: US-3390815!; isotype: PTBG!).

**Description.** Shrubs 0.2–1 m. Leaves opposite, clustered on upper 2–5 nodes, brittle, elliptic to elliptic-oblanceolate, 4–7.6 × 1.0–2.1 cm, upper surface glossy, green, glabrous, lower surface pale green, glabrous, margins irregularly and inconspicuously serrulate, apex acuminate, base attenuate, petioles 0.2–1.6 cm long. Flowers in loose, open cymes 3–6 cm long, arising in the upper leaf axils, cymes 1–3 flowered, peduncles 15–40 mm long, ca. 1–1.5 mm in diameter, pedicels 10–18 mm, bracts lanceolate, ca. 6–8 mm; calyx funnelform, white, ca. 11–15 mm long, lobes 5–9 mm long, subequal, glabrous, deciduous after anthesis; corolla white, funnelform, tube ca. 24–26 mm long, lobes ca. 6–8 mm long. Immature berry 15 mm long.

**Distribution.** Marquesas Islands, rare, endemic to high ridges of Ua Pou, from Oave and Matahenua to Teavahaakiti, Tekahuipu, and Tekohepu, 790–945 m.

**Ecology.** *Cyrtandra kenwoodii* is known only in cloud-swept summits with *Metrosideros collina* shrubland with other shrubs and small trees such as *Apetahia, Freycinetia*, and *Hibiscus*.

**Etymology.** This new species is named for Kenneth R. Wood, who first collected it and who has contributed greatly to our knowledge of the flora of the Marquesas and the Hawaiian Islands through his collections and field observations.

**Conservation status.** IUCN Red List Category: Critically Endangered EN B2a + B2b(i–iii). B2: total area of occupancy less than 10 km² (ca. 5 km²). B2a, a single population known; b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra kenwoodii* on Ua Pou (ca. 105 km²) is indicated as an endangered environ-

...ment, threatened feral animals and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined. Marquesas Islands. Ua Pou:** Central Ua Pou including the summit crest regions around Oave and the near-by peak of Matahenua, 899-924 m, 9°23’45.4”S, 140°4’43.3”W, 2 July 2004, Wood & Perlman 10804 (PTBG, US), 10813 (PTBG); ridge just north of Oave, between Oave and Matahenua, high mountain peaks along main backbone ridge, 945 m, 9°23’45.5”S, 140°4’43.3”W, 3 July 2004, Perlman & Wood 19088 (PTBG, US); Teavahaakit, steep slopes of main ridge to S of Oave, N & E facing cliffs between Teavahaakit & Tekohepu, 869 m, 5 July 1997, Perlman & Wood 15911 (MO, P, PAP, PTBG, US, WU).
Discussion. The sample of *Cyrtandra kenwoodii* used (Wood & Perlman 10804) in the molecular study by Clark et al. (2009) was identified as *C. feaniana*, prior to realization that the diminutive plants from Ua Pou represented an undescribed species. The molecular data show that *C. kenwoodii* is in a polytomy along with the two primary clades of Marquesan species, but is grouped here with the plicate species as it has the calyx only divided about half way to the base, but is not plicate as far as is known.

Divided calyx group

http://species-id.net/wiki/Cyrtandra_feaniana
Fig. 9

**Type.** Marquesas Islands: Hiva Oa: Feani, 800 m, 8 December 1921, F.B.H. Brown 827 (holotype: BISH-509530!)

**Description.** Shrub 1.5–3 m; stems glabrous or with a few scattered hairs when young. Leaves opposite, lanceolate to elliptic, 2.5–19 × 1.3–7.2 cm, glabrous, margins crenulate-serrulate, apex acute or acuminate, base cuneate, petioles 1–5 cm. Flowers 1-3 in cymes arising in the leaf axils, usually somewhat shorter than the leaves, glabrous or with scattered hairs, peduncles 10–45 mm long, ca. 0.5–1.5 mm in diameter, pedicels 18–35 mm long, bracts inconspicuous, narrowly lanceolate or triangular, 1–5 mm long, deciduous; calyx usually white, occasionally greenish white, 10–24 mm, divided nearly to the base, lobes lanceolate, tardily deciduous; corolla white, glabrous externally, tube 18–23 mm long, the lobes subequal, broadly obovate, 10–12 mm long; ovary narrowly ovoid, glabrous, style ca. 7 mm long, minutely puberulent. Berries pale orange, ca. 15 mm long, narrowly ovoid, glabrous.

**Distribution.** Marquesas Islands, occurring on Hiva Oa and Tahuata, and known from a few collections made in 1922 on Nuku Hiva and Ua Huka, from 700 to 1100 m.

**Ecology.** *Cyrtandra feaniana* is known from ridges and summit areas of montane wet forest dominated by *Metrosideros collina* and other shrubs and trees such as *Weinmannia marquesana* forest with diverse fern understory and other shrubs and trees such as species of *Coprosma, Crossostylis, Freycinetia, Ilex, Melicope, Polyscias, Psychotria,* and *Xylosma.*

**Conservation status.** IUCN Red List Category: Endangered EN B1ab (i,ii,iii) + 2ab (i,ii,iii). B2: total area of occupancy less than 5000 km² (ca. 799 km²). B1a, severely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra feaniana* on Nuku Hiva (ca. 340 km²), Ua Huka (ca. 83 km²), Hiva Oa (ca. 315 km²), and Tahuata (ca. 61 km²) is restricted to mountain slopes and summits, indicated as an endangered environment that is threatened by human activity (deforestation and fire), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined.** Marquesas Islands. Nuku Hiva: Toovii, 800–1000 m, October 1922, Quayle 1335 (BISH, BKL, US). Ua Huka: 9 November 1922, Quayle, 1792 (BISH); 9 November 1922, Quayle 1750 (BISH). Hiva Oa: Feani, 800 m, Brown 827

Discussion. Cyrtandra feaniana along with the closely related C. ootensis are the most commonly occurring species of Cyrtandra in the Marquesas Islands. In addition C. feaniana has the widest distribution, along with C. ootensis, occurring on four islands, although seemingly rare on Nuku Hiva and Ua Huka and has not been collected on either island since 1922. Specimens with more than a few hairs on various parts of the plant are here identified as C. ootensis. This includes all of the specimens from Fatu Hiva that are nearly glabrous, but have much larger leaves than other populations of C. ootensis. Alternatively, it is possible that these glabrate Fatu Hiva populations represent hybrids or hybrid derivatives between C. feaniana and C. ootensis. This hypothesized hybridization if correct would require the colonization of Fatu Hiva by C. feaniana followed by hybridization with C. ootensis to produce the glabrate larger-leaved plants.

Fig. 10

Type. Marquesas Islands: Ua Huka: 600 m, 9 November 1922, E. H. Quayle 1755 (holotype: BISH-145694!).

Type. Marquesas Islands: Hiva Oa: Ootua, 800 m, 15 December 1921, F.B.H. Brown 961 (holotype: BISH-509956!).
**Description.** Shrub 1.5–4 m. Leaves opposite, elliptic to ovate, 12–28 × 5-15 cm, whitish to ferruginous pubescent, or rarely nearly glabrous, and then younger leaves with at least some hairs, margin crenate-serrate, base unequal and broadly cuneate to attenuate, apex obtuse to acute or acuminate, petioles (1.5–) 4–10 cm. Flowers 1–3 in cymes arising in the leaf axils, peduncles 5–90 mm long, ca. 1–2 mm in diameter, pedicels subtending a central pedicel 2–50 mm long, bracts lanceolate, 2–10 mm long; calyx pale green or occasionally white, 11–20 mm long, divided nearly to base, deciduous, usually densely pubescent externally; corolla tube 25–32 mm long, lobes 5–6 mm long; ovary 7–15 mm long pubescent, style 6–18 mm long, pubescent. Berries pubescent, cylindrical, 2.1 cm long. Seeds ovoid, 0.4–0.5 mm long, the coats sculptured with coarse polygonal reticulations.

**Distribution.** Marquesas Islands, occurring on Hiva Oa and Tahuata, and two collections from Ua Huka, 670–1130 m.

**Ecology.** *Cyrtandra ootensis* is known from ridges and summit areas of montane wet forest dominated by *Metrosideros collina* and other shrubs and trees such as species of *Coprosma*, *Cossystlis*, *Freycinetia*, *Ilex*, *Melicope*, *Polyscias*, *Psychotria*, *Weinmannia*, and *Xylosma*.

**Conservation Status.** IUCN Red List Category: Endangered EN B1ab (i,ii,iii) + 2ab (i,ii,iii). B2: total area of occupancy less than 5000 km² (ca. 564 km²). B1a, severely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra ootensis* on Ua Huka (ca. 83 km²), Ua Pou (ca. 105 km²), Hiva Oa (ca. 315 km²), and Tahuata (ca. 61 km²) is restricted to mountain slopes and summits, indicated as an endangered environment that is threatened by human activity (deforestation and fire), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined.** *Marquesas Islands. Ua Huka*: 9 November 1922, Quayle 1790 (BISH). *Hiva Oa*: Mt. **Discussion.** When Fosberg and Sachet (1981) described the three varieties of *Cyrtandra ootensis* they stated that the species was not uniform in the variation of density of pubescence, density of toothing on leaf margins, length of petiole, in the length and openness of the inflorescence, and in the width of the corolla. They also pointed out that there was not much correlation among these variable characters, but nevertheless subdivided *C. ootensis* into four varieties. The significant amount of new collections since those available to Fosberg and Sachet since 1981 have shown that there is essentially complete intergradations among these characters and there are no clear ecologically or geographically based morphological patterns, and we have therefore placed these names into synonymy. The only pattern of variation noted is the large-leaved more glabrate plants discussed under *C. feaniana* that may represent hybridization on Fatu Hiva. Another case of possible hybridization on Tahuata is noted by the collections *Wood 6571*, which is included in *C. ootensis*, but is intermediate toward *C. feaniana*. *Wood 6570* collected close by is typical of *C. feaniana.*

Fig. 11

**Type.** Marquesas Islands: Tahuata: Above Hamatea, on central crest of U’ua’o, 850 m, 31 May 1975, J.-C. Thibault 83 (holotype: US-2969232! & US-2969234!, mounted on 2 sheets; isotype: US!).

**Description.** Shrub to 1–4 m tall; stems ferruginous pubescent. Leaves opposite, densely ferruginous pubescent, elliptic to broadly elliptic, 12–22 × 5–9.5 cm, apex acuminate, base attenuate, margins serrate, petioles 2–5 cm long. Flowers 1–3 in cymes to 20 cm, peduncles 6–8.5 cm long, ca. 2–3 mm in diameter, pedicels 20–35 mm, bracts ca. 4 mm; calyx green, 12–20 mm, divided almost to base, densely ferruginous pubescent deciduous; corolla ca. 25 mm long, tube cylindrical, 18–20 mm long, lobes suborbicular; ovary ca. 8–14 mm, densely pilose, style 4–5 mm, densely pilose. Immature fruit narrowly ovoid, ca. 15 mm long, densely pubescent.

**Distribution.** Marquesas Islands, occurring on Hiva Oa and Tahuata, from 690 to 830 m.

**Ecology.** *Cyrtandra tahuatensis* is known from ridges and summit areas in wet forest and shrubland with shrubs and trees such as species of *Coprosma, Crosostylis, Freycinetia, Ilex, Melicope, Metrosideros, Polyscias, and Weinmannia*.

**Conservation status.** IUCN Red List Category: Endangered EN B1ab(i,ii,iii) + 2ab(i,ii,iii). B2: total area of occupancy less than 5000 km² (ca. 376 km²). B1a, severely fragmented; B1b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra tahuatensis* on Hiva Oa (ca. 315 km²), and Tahuata (ca. 61 km²) is restricted to mountain slopes and summits, indicated as an endangered environment that is threatened by human activity (deforestation and fire), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Specimens examined.** Marquesas Islands. Hiva Oa: Mt. Ootua, 750 m, 27 February 1975, Oliver & Schäfer 3223 (BISH, US); road from Atuona to Pumamau, just below Mt. Ootua, 660-690 m, 22 January 1975, Sachet, Oliver & Schäfer 2127 (BISH, CBG, CHR, NSW, PTBG, US). Tahuata: ridge from Amatea to Moteve passing Meikaea, view down is on village of Hanatetena, on W side of ridge, 823 m, 13 July 1997, Perlman, Wood & Luce 15976 (MO, NY, P, PAP, PTBG, US, WU); ridge E of trail ridge up to Amatea from Kuae, W facing slope, 774 m, 9°56’S, 139°4′W, 17 -19 July 1997, Wood 6553 (PTBG); Wood 6563 (AD, BISH, HAST, MO, NY, P, PAP, PTBG, US, WU); summit ridge near Haaiiputeomo, satellite dish region NE of Vaitahu, 762- 823 m, 9°57′19″S, 139°5′7″W, 17 -19 July 1997, Wood 6553 (PTBG), Wood 6563 (AD, BISH, HAST, MO, NY, P, PAP, PTBG, US, WU); Amatea region, locations around Haaoiputeomo satellite dish (parabowl), 823 m, 9°0.2′S, 139°8′W, 4 Jul 2003, Wood 10266 (PAP, PTBG, US). Fatu Hiva: Mounanui slopes,

from Teavapuiahua pass, in gulches below mt., 680 m, 10°28'49.7"S, 138°38'17.0"W, 6 Feb 2003, Perlman 18399 (BISH, P, PAP, PTBG, US); slopes of Mounanui, 719 m, 10°28'6.63"S, 138°38'18"W, 16 July 2005, Perlman 19667 (BISH, P, PAP, PTBG, US); Crete du Mt. Mounanui, 805 m, 10°28'S, 138°37'W, 26 July 1988, Florence & Perlman 9589 (PTBG, US).

**Discussion.** Perlman 18399, Wood 6563, and Wood 10266 were identified as *Cyrtandra ootensis* var. *mollissima* in the molecular study of Clark et al. (2009), but are here considered to represent *Cyrtandra tahuatensis*.

**Type.** Marquesas Islands: Fatu Hiva: Base of Mt. Natahu, on cliff face, 828 m, 1–3 August 1977, B. H. Gagné (S. L. Montgomery coll.)1276 (holotype: BISH-510504; isotype: US!).

**Description.** Shrub ca. 0.2–0.3 m, with thick fleshy stems, densely woolly pubescent. Leaves opposite, very crowded on upper 2–3 nodes, stiff-coriaceous, elliptic, 7–10 × 3–5 cm, margins strongly revolute, apex obtuse, bases attenuate to cuneate, upper surface thinly long pilose, glabrate, lower surface densely ferruginous pubescent, petioles 0.5–1 cm. Flowers in condensed cymes, 2–2.5 cm, crowded between the leaves, bracts elliptic, ca. 10–15 mm long, peduncles 5–8 mm, ca. 1–2 mm in diameter, pedicels 6–13 mm; calyx ca. 13–15 mm long, divided ca. ¾ its length; corolla white (none available on specimen). Berry unknown.

**Distribution.** In the Marquesas known only from the type collections on Fatu Hiva at 830 m.

**Ecology.** The type was collected on a cliff face, but the specific ecology of *Cyrtandra revoluta* is unknown.

**Conservation status.** IUCN Red List Category: Critically Endangered CR B2a + 2b (i, ii, iii). B1, total extent of occurrence less than 100 km² (ca. 85 km²), a,b, known from a single location; B2a, estimated area of occupancy estimated to be less than 10 km² [one collection known]; B2b (i–iii), habitat continuing decline inferred. The estimated area of occupancy for *Cyrtandra revoluta* on Fatu Hiva (less than 10 km²) is indicated as an endangered environment, threatened by human activity (deforestation and fire), feral animals, and invasive plant species, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

**Discussion.** *Cyrtandra revoluta* is quite distinctive in its short stature and its stiff-coriaceous, revolute leaves. It is known from only one incomplete specimen making assessment of its relationships difficult. The deeply divided, green calyx suggests that it is part of the divided calyx group.

Fig. 12

**Type.** Marquesas Islands: Nuku Hiva: Tovii, 800 m, October 1922, E. H. Quayle 1279 (holotype: BISH-509964!).
Description. Shrubs 1.5–2 m tall; stems usually few. Leaves opposite, borne on upper few nodes, peltate, suborbicular, 7–10 × 6–9 cm, ferruginous glandular pubescent, margins coarsely dentate, petioles 5–10 cm. Cymes few-flowered, ca. 2.5–3 cm; bracts ca. 5–6 mm, deciduous, peduncles ca. 10 mm, ca. 1.5–2 mm in diameter, pedicels 12–25 mm; calyx campanulate, 10–17 mm, densely ferruginous glandular pubescent, divided ca. ¼–1/3 of length, lobes acute, 4–5 mm; corolla funnelform, tube ca. 25–35 mm, the lobes rounded, ca. 6–10 mm; ovary conical-ovoid, 5 mm, glabrous; style ca. 13 mm long, glabrous in the lower portion, slightly pubescent near the apex. Berry ovoid, ca. 15 mm long.

Distribution. Marquesas Islands, very rare or perhaps extinct, endemic to Toovii Plateau, Nuku Hiva, ca. 800–900 m. It is known from three collections collected in 1844, 1922, and the most recent in 1982.

Ecology. *Cyrtandra toviana* is known only in *Metrosideros collina* woodland.

Conservation status. IUCN Red List Categories: Critically Endangered CR B2a + 2b (i, ii, iii). B1, extent of occurrence estimated to be less than 100 km²; B2, area of occupancy estimated to be less than 10 km² (ca. 9 km²), and B2a, a single population known; b (i–iii), habitat continuing decline inferred. The suitable habitat for *Cyrtandra toviana* on Nuku Hiva (ca. 340 km²) is indicated as an endangered environment, threatened by human activity (deforestation), feral animals, and invasive plants, reducing the extent of the forest (Florence and Lorence 1997; Mueller-Dombois and Fosberg 1998; Meyer and Salvat 2009).

Specimens examined. Marquesas Islands. Nuku Hiva: 1844, Le Bâstard (P [2]); Toovii, Quayle 1279 (BISH); Toovii, épaulement au-dessus du réservoir, 895 m, 8°52’S, 140°9’W, 7 December 1982, Florence 4324 (BISH, P).

Discussion. *Cyrtandra toviana* is unique within Marquesan *Cyrtandra* with its peltate leaves and small campanulate calyx. In fact, it could well represent a separate introduction of the genus to the Marquesas Islands.

Putative hybrids

**Acknowledgments**

We are grateful to the Bishop Museum herbarium (BISH) for access and loans to their collections, which form a critical early component to understanding *Cyrtandra* in the Marquesas Islands. In addition to the images and observations made by two of the authors (W.L. Wagner and Lorence), the observations and descriptions were made possible by field observations, photos, and specimens provided by Ken Wood and Steve Perlman (National Tropical Botanical Garden) as part of the “Vascular Flora of the Marquesas Islands” project, which was supported by a generous private donation to the National Tropical Botanical Garden. We are grateful to the Délégation à la Recherche (Papeete, Tahiti), the Musée de Tahiti et des Îles, and the Service du Développement Rural for logistic support, the Délégation for permission to collect in the Marquesas, and the Délégation and the Haut-Commissariat de la République en Polynésie française for permission to conduct research. The illustrations were skillfully drawn by Alice Tangerini. We appreciate the image taken for the US Type Resister of *Cyrtandra uahukaensis* by Ingrid Lin and the download and edits by Nancy Khan of the specimens examined from the Marquesas database. We also thank John R. Clark for a review and comments on the draft manuscript as well as preparing the portion of the cladogram from his published original full phylogeny. The contribution by WLW to this study was partially supported by the Smithsonian Research Opportunities Fund and the National Tropical Botanical Garden McBryde Endowment for Hawaiian and Pacific Botany.
