6. LIST OF PLANTS COLLECTED ON COETIVY ISLAND, SEYCHELLES

by S. A. Robertson and F. R. Fosberg

Introduction

A visit was made by Robertson to Coetivy Island from 27 February to 3 March 1980. During that time as many parts of the island as possible were visited and a plant collection was made. 99 species were collected and another 22 noted, including crops but not obvious garden ornamentals. Two sets were made, one of which is incorporated in the Herbarium of the Ministry of Agriculture, Mahe, Seychelles, and the other lodged with the Herbarium, Royal Botanic Gardens, Kew, England. The first author is indebted to the Director, Royal Botanic Gardens, and his staff, in particular Mr S. Renvoize, for verifying the identifications. Included in the list are those species noted as occurring on Coetivy by Renvoize (1975); these are indicated by the abbreviation R. Most of them derive from the collections made by Gwynne and Wood (1969). Fosberg has been responsible for checking the nomenclature used, which conforms to that in others of this series of papers. Where these names differ from those used by Robertson (in press), the latter are given as synonyms. Families in the list are arranged alphabetically.

Coetivy (Figure 7) is a large sand cay of about 900 ha, 9.8 km long and 1.6 km wide at its widest point, aligned approximately north-east/southwest. The fringing reef is narrow and the main pass and settlement are slightly south of the mid point of the west coast. Coetivy is about 250 km south-south-east of Mahe and was named after the Chevalier de Coetivy, who sighted it on 3 July 1771. It is run as a coconut plantation.

The island is hedged with the usual beach-crest thicket of Scaevola sericea. This varies in width around the island and is greatest on the eastern coast. The northern and eastern parts of the island have the best soils and are covered with tall dense old coconut palms with a lush undergrowth of Nephrolepis biserrata, Pipturus argenteus and germinating

Figure 7. Coetivy
coconuts. The southern and western areas have very poor soil, almost pure sand, with stunted coconuts intermixed with *Scaevola sericea* and the ground sparsely covered with *Fimbristyli s cymosa* and *Eragrostis subaequiglumis* tussocks. There were no planted coconuts south of the airstrip, and this area is thickly covered with *Scaevola sericea* and *Cordia subcordata* matted with *Casytha filiformis* and *Canavalia cathartica*. There are several large dunes, up to 10 metres high, scattered over the island, and some fresh-water marshes, the largest being behind the settlement and reputed in island lore to be bottomless.

Plantations of exotic tree species such as *Tabebuia heterophylla*, *Neisosperma oppositifolia* and *Adenanthera pavonia* have been established in various parts of the island and have self-seeded successfully. *Casuarina equisetifolia* is, however, the most common tree after *Cocos nucifera*.

Of interest were the small herd of feral donkeys which graze the open areas, the frigate bird roosting colony in tall old coconut palms just south of La Butte (the large central dune), and the relative scarcity of land birds. Only Barred Ground Doves, partridges, egrets and migrant European Rollers were seen. There were no skinks but an abundance of grasshoppers, butterflies and day-flying moths.

The first author would like to thank the Government of Seychelles for permission to visit and collect on the island, and the island staff for their hospitality.
