

Deep-Sea Coral Taxa in the U. S. Caribbean Region: Depth and Geographical Distribution

By Stephen D. Cairns¹

1. Department of Invertebrate Zoology, National Museum of Natural History, Smithsonian Institution, Washington, D.C.

An update of the status of the azooxanthellate, heterotrophic coral species that occur predominantly deeper than 50 m in the U. S. Caribbean territories is not given in this volume because of lack of significant additional data. However, an updated list of deep-sea coral species in Phylum Cnidaria, Classes Anthozoa and Hydrozoa, from the Caribbean region (Figure 1) is presented below. Details are provided on depth ranges and known geographic distributions within the region (Table 1). This list is adapted from Lutz & Ginsburg (2007, Appendix 8.1) in that it is restricted to the U. S. territories in the Caribbean, i.e., Puerto Rico, U. S. Virgin Islands, and Navassa Island, not the entire Caribbean and Bahamian region. Thus, this list is significantly shorter. The list has also been reordered alphabetically by family, rather than species, to be consistent with other regional lists in this volume, and authorship and publication dates have been added. Also, *Antipathes americana* is now properly assigned to the genus *Stylopathes*, and *Stylaster profundus* to the genus *Stenohelia*. Furthermore, many of the geographic ranges have been clarified and validated. Since 2007 there have been 20 species additions to the U.S. territories list (indicated with an asterisk in the list), mostly due to unpublished specimens from NMNH collections. As a result of this update, there are now known to be: 13 species of Antipatharia, 45 species of Scleractinia, 36 species of Octocorallia, and 14 species of Stylasteridae, for a total of 108 species found in the relatively small geographic region of U. S. Caribbean territories.

Recommended citation: Cairns SD (2017) Deep-Sea Coral Taxa in the U.S. Caribbean Region: Depth and Geographical Distribution. Online resource: <https://deepseacoraldata.noaa.gov/>.

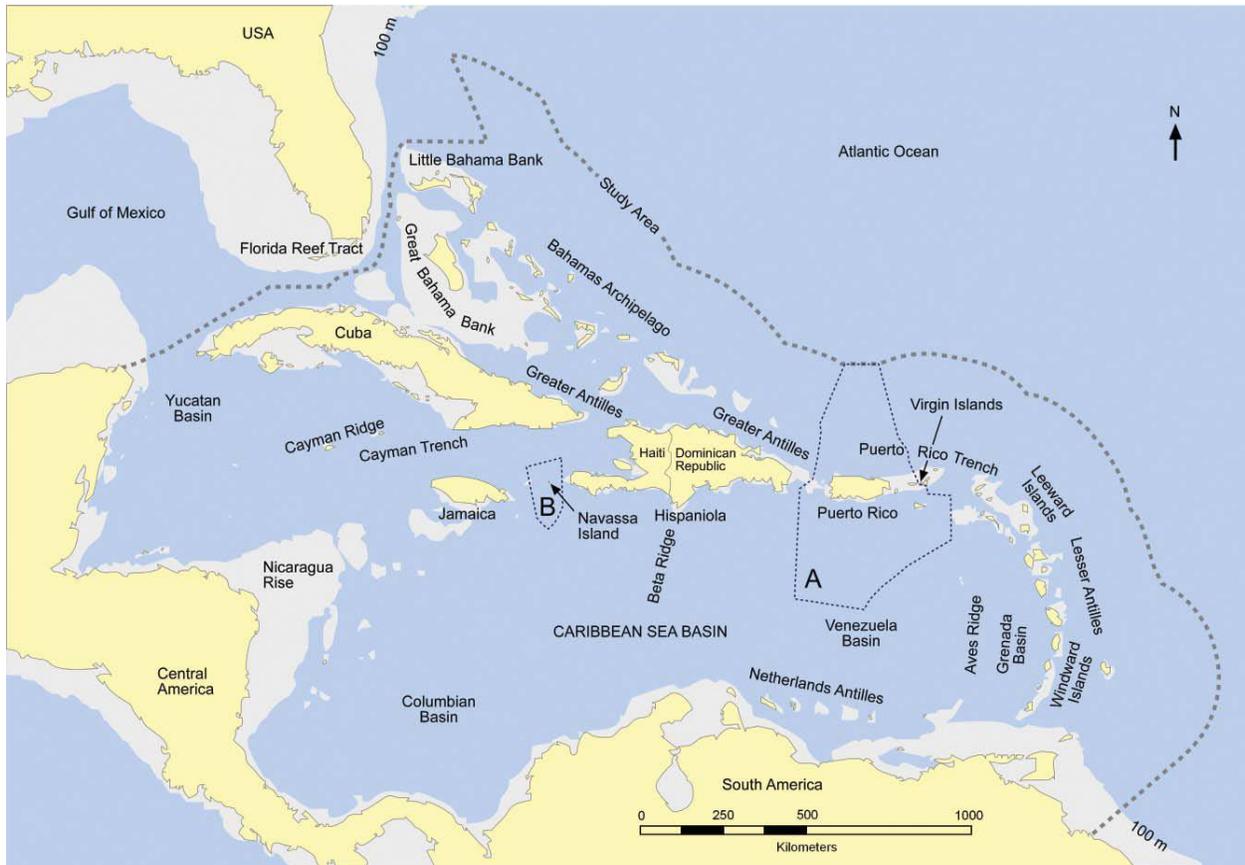

Figure 1. The greater Caribbean region (map from Lutz & Ginsberg, 2007). The current list covers deepwater corals recorded from U.S. waters around (A) Puerto Rico and the U.S. Virgin Islands and (B) Navassa Island. The deep-sea coral list from Lutz & Ginsberg (2007) covered the entire Caribbean (indicated by the dashed line “Study Area”).

Table 1. List of known deep-sea coral species in Phylum Cnidaria, Class Anthozoa and Class Hydrozoa, and their reported distributions in U.S. waters around Puerto Rico, the U.S. Virgin Islands, and Navassa Island. Bold text and blue-shaded fields indicate newly described species, new list additions, or range extensions since Lutz & Ginsberg (2007). No symbols before bold & blue-shaded species names indicate newly described species, asterisks (*) denote new list additions, crosses (†) show name changes, and bold & blue-shaded depth and/or region fields represent range changes. “NR” indicates a lack of reported distribution or depth information. References are numbered to correspond with citations following the table.

Distribution: PR = Puerto Rico; VI = U.S. Virgin Islands; N = Navassa.
